CAP	Capacitor	M2	Motor, Conveyor	SSR1	Solid State Relay
CB	Circuit Breaker	OMC	Oven Machine Control	TB1	Terminal Block
H1-3	Heating Elements	PS	Power Supply	TC	Thermocouple
LUI	Large User Interface	PU	Pick-Up	TS	Terminal Strip
M1	Motor, Oven Fan	R1	Oven Fan Motor Relay		

Once the oven is plugged into the wall the Oven Machine Control (OMC) Power Light will illuminate.

When the main power on the Large User Interface (LUI) is turned on:

1. The LUI will illuminate and display actual temperature until set point is reached as well as display belt time.
2. The Oven Fan Motor (M1) located in the Back Wall will run, illuminating the Main Fan Light on the OMC.
3. The heating elements will receive power, illuminating the Heat Light on the OMC.
4. The conveyor belt will move, illuminating the Conveyor Light on the OMC.

The first part of the Theory of Operation explains how electrical power is delivered to the oven and initial sequences when the main power button on the LUI is turned on. The second part of the Theory of Operation section explains the function of components in alphabetical order. These components are also listed on the schematic.

- Line voltage for Standard Ovens is assumed to be 208 or 220/240 VAC, 1 Φ , 60 Hz.

Part 1:

Power originates at the electrical connection on the wall. Line voltage is carried into the oven through the power cord to the Terminal Block (TB). Wires coming off the terminal block lead to the Terminal Strip (TS1), which then continues on to the Power Supply (PS), the Solid State Relay (SSR), Oven Fan Motor Relay (R1), Oven Fan Motor (M1) and Heating Elements (H1-H2). The PS then converts the line voltage into 24 VDC. From PS +24 VDC is distributed through TS1 to the Oven Machine Control (OMC) P4-1, OMC P4-2 and -24 VDC is distributed to R1 and OMC P10-3. TS1 then distributes +24 VDC to OMC P10-4, via CB2. These wires are live as long as the oven is connected to power on the wall.

When the oven is turned on, a relay inside the OMC closes between P4-2 and P4-3, sending +24 VDC out of P4-3 to the SSR1. A relay inside the OMC closes sending +24 VDC out of P11-1 to R1. Once R1 has received the low voltage the relay will close, allowing line voltage from R1 to M1, via CB1. OMC P11-2 carries -24 VDC to SSR1, which then closes SSR1 allowing line voltage to the heating elements allowing the oven to start heating.

Part 2:

CAP - The Capacitor is physically mounted inside the Control Box but wired to the externally mounted M1. The M1 is a Permanent Split Capacitor (PSC) motor. PSC means a capacitor motor in which the starting capacitor and the auxiliary winding remain in the circuit for both starting and running. The CAP is a 7.5 uF +/- 6% 370VAC/B 50/60 Hz.

CB - Circuit Breakers are used to protect electrical components. The current value is printed on the front of all breakers. If a CB is tripped, eliminate the cause and press the front to reset.

H1-H3 - The Heating Elements convert electricity into heat through the process of joule heating. Electric current through the element encounters resistance, resulting in heating the element. The resistance values of the three (3) different part numbers used are:

- 96-5201x2800-208 2800 Watt 15.45 Ohms
- 96-5201x3000-240 3000 Watt 19.20 Ohms
- 96-5201x2000-380 2000 Watt 72.20 Ohms

Please refer to the Parts section for the proper application.

LUI - The Large User Interface is powered by +5 VDC from the OMC via the RS-485 cable. The main power button is located on the front face of the LUI. The conveyor(s) and temperature of the oven is controlled through the LUI. The LUI and OMC communicate via the 485± on the RS-485 cable. The LUI will display error messages and maintenance alarms. There are twelve (12) menu presets for predetermined time and temperature settings. The screen can be locked to prevent unwanted changes.

M1 - The Oven Fan Motor for standard ovens is a PSC, single phase, capacitor run motor. The motor is dual voltage. The voltage to power the motor comes from R1. The main motor will continue to operate for approximately thirty (30) minutes or until the oven temperature is less than 225°F/107°C after the oven is turned off. There are no user serviceable parts in the motor, and the bearings are permanently lubricated.

M2 - The Conveyor Motor is a brushless 24 VDC gear motor. The motor receives current from the OMC through three (3) wires; 1) A green or “W” phase, 2) a blue or “V” phase, and 3) a yellow or “U” phase. They carry between 18 to 24 VDC, depending on the time set on LUI. Each wire is energized by the OMC in sequence to provide power to the individual stator coils which, in turn, provide motor rotation. Three (3) Hall Effect switches are used to determine and communicate the rotor position. They read the rotational information from a disc mounted on the rotor assembly. This information is transmitted to the OMC by three (3) wires; 1) a blue “U” phase pole signal output, 2) a green “V” phase pole signal output, and 3) a yellow “W” phase pole signal output. These are located in a plug that inserts into the OMC. There are two (2) additional wires in this plug; 1) a red wire which is supply voltage for the pole sensor, and 2) a black wire that is ground. The motor drives an integral gear box that reduces the motor output speed to give the correct travel time to the conveyor belt. This motor contains no serviceable parts. The OMC will detect if the conveyor belt has a jam by monitoring the rotor signal. If the signal falls more than 25% below the expected rate a jam is detected. This action will stop the conveyor and display Belt Jam error on the LUI.

OMC - The Oven Machine Control reads selections or parameters from the LUI via the RS-485 cable. It holds the logic for the conveyor control and the temperature control. The OMC will turn on or off the SSR, start and stop M1, send the call for heat signal, and reads the thermocouple.

PS - The Power Supply rectifies line voltage to 24 VDC, and supplies power to the OMC.

PU - The Pick-Up is physically mounted within M2 and utilizes Hall Effect technology integral to the M2 to monitor the rotation speed. The Hall Effect signal is transmitted to the OMC, which converts it into linear travel speed of the conveyor.

R1 - The Oven Fan Motor Relay is used as a remote switch to control the high voltage power to M1.

SSR1 - A Solid State Relay is an electronic switching device in which a small control signal from the OMC controls a larger load current and voltage. A solid-state switching device, which switches power to the Heating Elements (H1-H2) either on or off, and does this without mechanical parts.

TB1 - The terminal block is used to secure and terminate wires from the power cord going into the oven.

TC - The thermocouple is a type K. It consists of two different conductors that produce a voltage proportional to a temperature difference between either ends of the pair of conductors. The TC is connected to P8 Terminals 1 & 2 on the OMC. The millivolt signal is used to display the actual temperature.

Proper Cooking

Experimentation is about the only way to determine proper time and temperature settings. While a pizza may look perfectly cooked on the outside, the inside may be undercooked. A thermometer is necessary to determine if food items are being properly cooked. Most health departments have rules and regulations that establish minimum temperatures for internal food temperatures. Most operators want to cook foods as fast as possible in order to serve more customers per hour. However, cooking foods slower is the only way to achieve a proper internal temperature. If your food products look acceptable on the outside, but have an internal temperature that is too low, then lowering the temperature and decreasing the belt speed (thereby increasing the cook time), will be necessary.

Several factors may affect the cooking performance and characteristics:

- Oven temperature (generally affects color)
- Conveyor speed (generally affects doneness)
- Finger Arrangement
- Altitude
- Pans versus screens
- Dough thickness
- Cheese type
- Raw ingredient temperature (frozen?)
- Quantity of toppings

XLT ovens are configured to cook a wide variety of food items. Generally speaking, most cooking is a “bottom up” process. The hot air from the bottom row of fingers has to go through the conveyor (a distance of about 1 1/4” / 31.75mm), heat the pan or screen, and then actually cook raw dough. The hot air from the top, on the other hand, basically only has to melt cheese and re-heat precooked toppings. Consequently, the fingers operate with more air directed to the bottom of the pizza than to the top. There are places for an equal number of fingers above and below the conveyor. **All of the fingers must be properly installed. Incorrect or incomplete finger placement can alter final bake.**

Mechanical Function

If your oven does not function properly, please verify the following conditions:

1. Verify that the power cord to the oven is connected and plugged in.
2. Check to see that the circuit breakers in the building electrical service panel have not been tripped or turned off.
3. Check all circuit breakers on the back of the oven control box to ensure they have not been tripped.

**HIGH
VOLTAGE**

Proceed with caution and read the following instructions carefully before performing a hard reset on the unit.

Hard Reset

If your oven still does not function properly, perform a hard reset. First, power down the unit then unplug the unit from all electrical power. Leave the unit unplugged for one (1) minute. Once this is done, plug the unit back in and turn on the power.

**TIP**

Read and understand the next four (4) steps first. They illustrate how to remove links from a stretched wire belt.

- 1 Locate the row of Master Links by allowing the conveyor to run until they are positioned as below.

- 2 Using Needle Nose Pliers, remove the Master Links.

**NOTE**

Place Master Links on the top of the oven or a surface in the orientation and order they were removed to ease reinstallation

- ③ Remove the necessary number of links.

Start with removing one (1) link and if the wire belt overlaps when the ends are brought together, continue to remove links until they no longer do.

- ④ Using Needle Nose Pliers, reinstall the Master Links in their original orientation.
